

2 literature review

July 2026

1 Literature Review

1.1 Feedback & Evaluation

The lecturer's assessment of the project was overall positive. Key strengths identified included the thorough data preprocessing pipeline, the robust model comparison, and the clear visualization of results. The lecturer appreciated the use of both statistical tests (Chi-Square, ANOVA) and advanced regression techniques (Gradient Boosting, Decision Trees). However, some minor concerns were raised, such as the absence of temporal or economic factors, which could further refine price prediction.

1.2 Suggested Improvements

Several areas of enhancement were suggested. First, incorporating temporal data such as economic trends or regional market conditions could improve predictive accuracy. Second, additional feature engineering, such as interaction terms or polynomial features, could be explored. Finally, testing other algorithms, such as XGBoost or neural networks, may yield further improvements.

1.3 Final Grading Criteria

The final grading is based on the following breakdown:

- Documentation: 30%
- Data Preprocessing and EDA: 20%
- Model Implementation and Tuning: 25%
- Testing and Evaluation: 15%
- Presentation: 10%
